CASE FILE COPY

(U) ABSTRACT

The actual trajectories for capsule and booster of Mercury-Redstone test flight MR-2 are presented in this report. The main parameters presented are position, velocity, acceleration, trajectory angle, Mach number and dynamic pressure.

April 4, 1961

Report No. MTP-AERO-61-30

ACTUAL TRAJECTORY OF MERCURY-REDSTONE FLIGHT
TEST MR-2 (U)

INTRODUCTION

(C) Mercury-Redstone test flight MR-2 was launched from AMR on 31 January 1961 at 1154:51 EST. MR-2 was the second of a series of flights which are designed to qualify the Mercury-Redstone for brief manned space flights.

The trajectories for both capsule and booster are presented in this report. The capsule trajectory was established to show its position in reference to that of the booster from separation to impact. The official capsule trajectory will be published by Space Task Group.

(U) The following tracking data was available for establishing the post flight trajectory of both capsule and booster:

0.0 - 21.53 sec	:	Fixed Camera
0.0 - 485.0 sec	:	Dovap
3.25 - 137.75 sec	:	Theodolite
8.5 - 133.0 sec	:	Azusa
0.0 - 352.9 sec	:	FPS-16 Radar 1.16 (Capsule)
353.0 - 570.0 sec	:	FPS-16 Radar 3.16 (Capsule)

All times are referenced to Range Zero. Liftoff occurred .88 sec after Range Zero.

The origin of the coordinate systems used for capsule and booster trajectories is launch pad 5 which has the following geographical coordinates (based on the Clarke Spheroid of 1866):

Geodetic Latitude: 28.439139° N
Longitude : 80.573521° W

Mach number and dynamic pressure are based on measured Cape meteorological data to 32.8 km altitude in the ascent and adjusted to the 1959 ARDC Atmosphere at 47.0 km. The 1959 ARDC Atmosphere was used above 47.0 km for the capsule and booster trajectories in both ascent and descent. Grand Bahama Island Atmosphere was used below 47.0 km in the descent.

The smoothing and differentiation procedures used in these calculations round off the large transients that occur around cutoff; consequently, variables in this interval, 138 ± 3 sec, should not be used in any performance estimates.

The large velocity gain imparted to the capsule by the escape rockets eliminated any close approach between capsule and booster.

~~CONFIDENTIAL~~

(C) BOOSTER TRAJECTORY

The booster trajectory presented in this report was established from the following data:

0.0 - 12.0 sec : Fixed Camera
12.5 - 250.0 sec: Dovap
250.0 - Impact : Computed trajectory using Dovap positions and velocities as initial conditions at 250.0 sec.

Tables IB through IIIB contain the first section of the booster trajectory, 0.0 - 250.0 sec, which is based principally on Dovap data. Variables are given in 0.5 sec intervals through powered flight and in 5.0 sec intervals thereafter. Figure 1 is a comparison of other tracking data with the reference trajectory during powered flight. The maximum average deviations in the position coordinates were:

Deviations	
Theodolite	4 m
Azusa	12 m

Tables IVB and VB form the second section of the booster trajectory, 250.0 - 497.43 sec, with variables given in 5.0 sec intervals. This section is a calculated trajectory using Dovap positions and velocities as initial conditions at 250.0 sec.

Tables VIB through VIIIB form the dive phase (100 km altitude to impact) of the computed booster trajectory, 497.43 sec to impact, with variables given in 5.0 sec intervals. An aerodynamic drag coefficient, consistent with an assumption of a tumbling booster, was used in the calculations for this section of the trajectory. The adjustments which were applied to the product of the ballistic coefficient ($\frac{CDA}{m}$) and density resulted in an impact time which was identical to that of loss of signal from aircraft telemetry in the target area.

(C) IMPACT POINT (BOOSTER)

The geographic location of the impact point determined from the precalculated trajectory was:

Geodetic Latitude: 27.074569° N
Longitude : 75.696979° W

CONFIDENTIAL

The miss distances of the post flight trajectory with reference to the predicted impact point were:

Range (km)	Cross Range (km)	Radial (km)
81.05 over	13.72 right	82.20

The excessive range was directly attributable to a higher than predicted cutoff velocity. The lateral velocity also exceeded that which was predicted. This additional lateral velocity, which caused a significant change in the yaw plane, reached a maximum of 33 m/s at cutoff.

The booster impact locations from both the predicted and post flight trajectories are shown in Figure 2.

(C) CAPSULE TRAJECTORY

Tables IC through IIIC contain the first section of the capsule trajectory, 135.0 - 300.0 sec, with variables given in 5.0 sec intervals. This section is based on FPS-16 Radar 1.16 data.

Tables IVC and VC contain the second section of the capsule trajectory, 300.0 - 532.41 sec, with variables given in 5.0 sec intervals. This section is a computed trajectory using FPS-16 Radar 1.16 positions and velocities as initial conditions at 300.0 sec.

Tables VIC through VIIIC form the dive phase (100 km altitude to impact) of the computed capsule trajectory, 532.41 sec to impact, with variables given in 5.0 sec intervals. In these calculations it was assumed that both the drogue and main chute deployed at the predicted altitudes (25,000 ft and 10,000 ft respectively). Radiosonde winds from Grand Bahama Island were used from 26.5 km altitude to impact. The adjustments which were applied to the product of the ballistic coefficient and density resulted in an impact time consistent with that of capsule telemetry.

(C) IMPACT POINT (CAPSULE)

The capsule impact point determined from the predicted trajectory was:

Geodetic Latitude: 27.167083° N
Longitude : 76.041723° W

The differences between impact locations of both the post flight trajectory and Sofar Bomb with reference to the predicted impact location are shown in the table below:

	Range (km)	Cross Range (km)	Radial (km)
Reference Trajectory	198.04 over	24.78 right	199.58
Sofar Bomb	200.91 over	26.42 right	202.64

The additional range of the capsule was partially due to a higher than predicted booster cutoff velocity. A large impulse was also imparted to the capsule by the escape rocket's firing plus the fact that the retro-rockets are not fired in the abort mode. The extra cross-range was attributed to the excessive velocity in the yaw plane at booster cutoff and the escape rocket's firing at an angle of approximately 8.1 deg to the right of the flight path.

The capsule impact locations from the precalculated trajectory, reference trajectory, and Sofar Bomb are shown in Figure 2.

The tables in this report were prepared by the Data Reduction Branch and Trajectory Applications Unit of Computation Laboratory.

See page 5 for a list of trajectory symbols and their definitions.

(U) APPENDIX

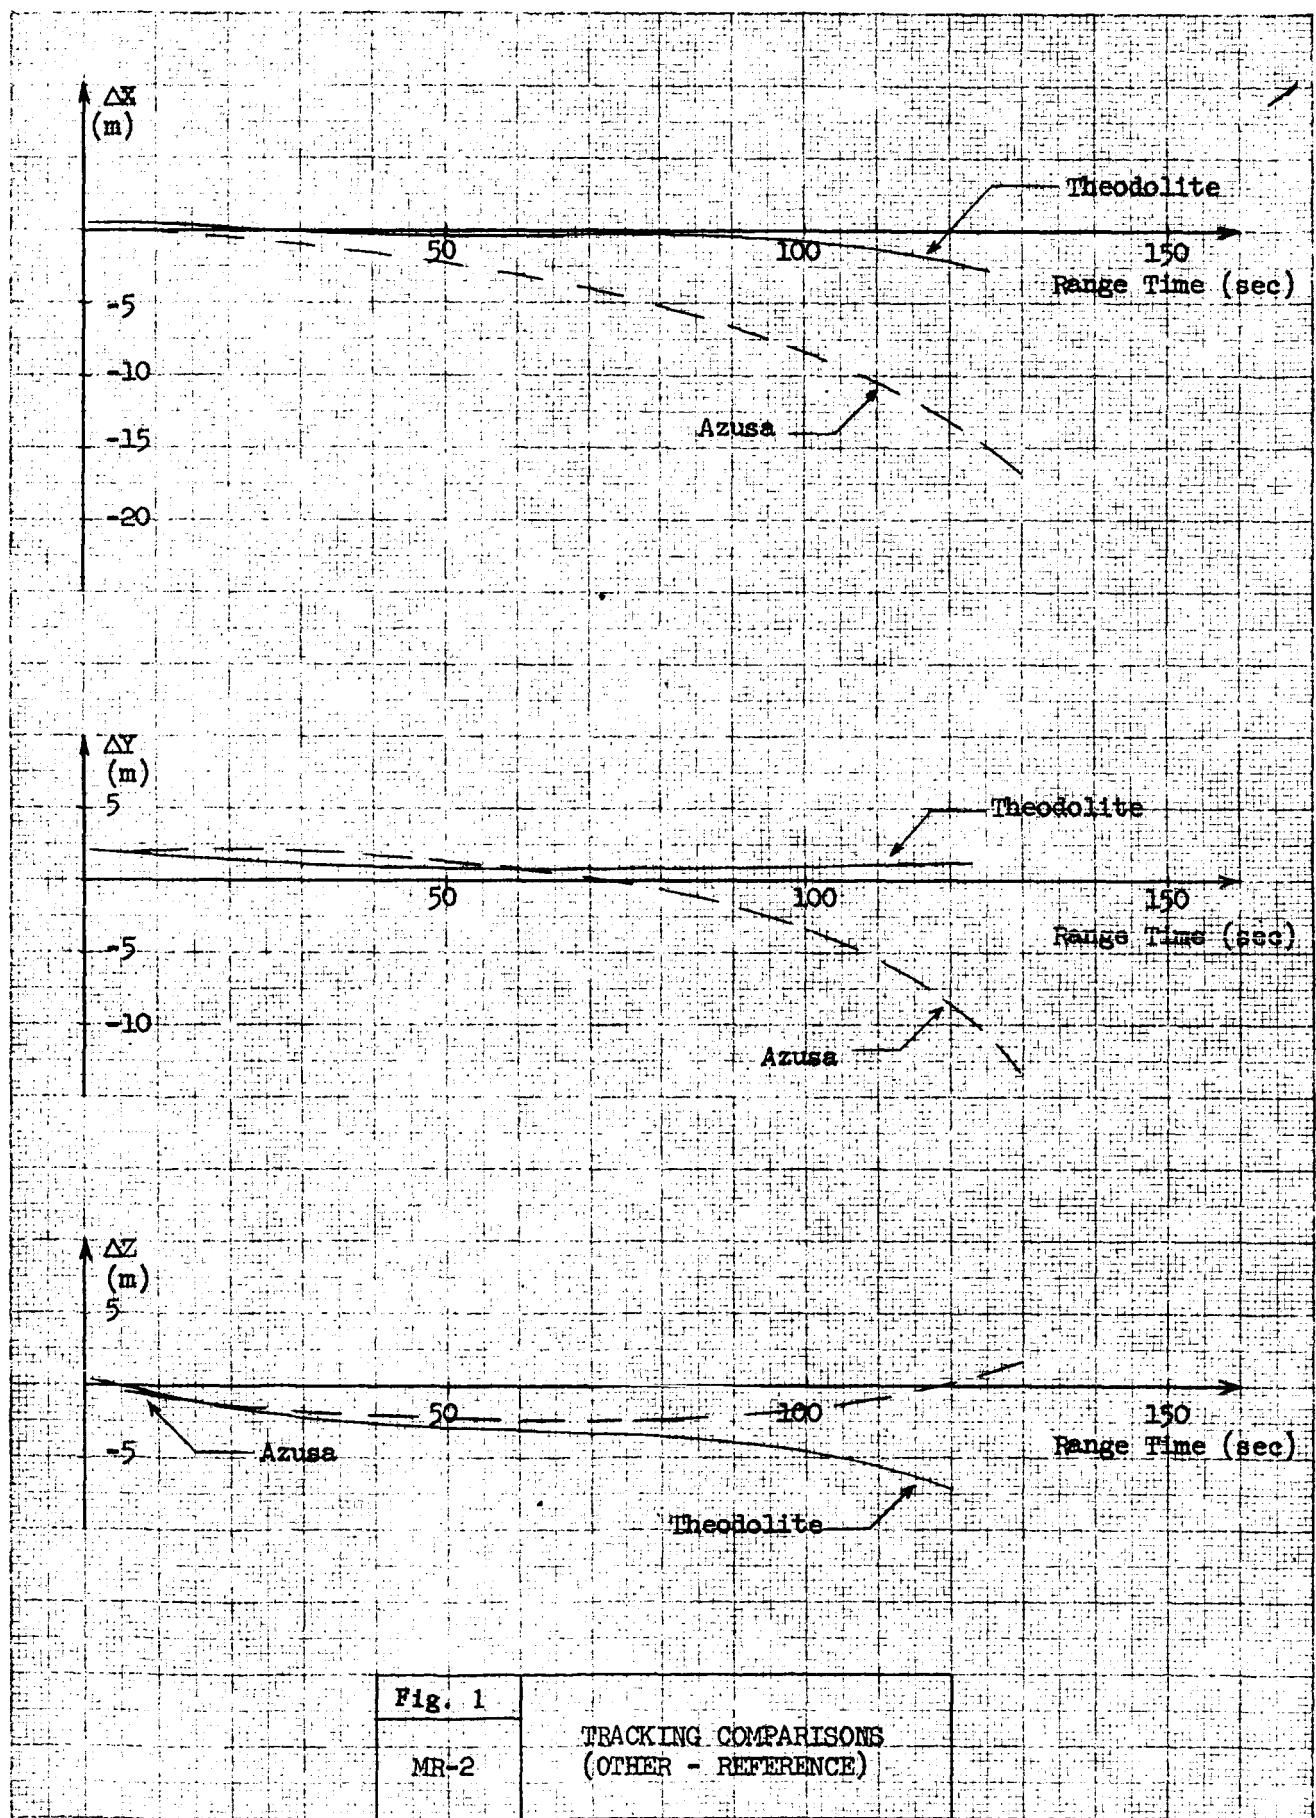

Symbols	Definitions
X	Cartesian coordinates with X Z plane tangent to the earth's surface at the launch site. The positive X coordinate is 105.00° E of N; the positive Z coordinate is 195.00° E of N. The positive Y coordinate is perpendicular upward from the X Z plane at the point of tangency.
Y	
Z	
X sph	Curvilinear coordinates oriented in the same manner as the Cartesian coordinates above and based on an earth radius of 6373334.6 m.
Y sph	
Z sph	
Vg	Earth-fixed geometric missile velocity.
\dot{V}_g	Tangential missile acceleration.
Mach	Ratio of velocity of missile to local velocity of sound.
Q	Dynamic pressure
Theta P	The angle between the earth-fixed missile velocity and the launch vertical. Defined mathematically as $\cos^{-1} \dot{Y}/V_g$.
Theta Y	The angle between the earth-fixed missile velocity and its projection into the XY plane. Defined mathematically as $\sin^{-1} \dot{Z}/V_g$.
Alt.	Altitude, height above the geoid as represented by the Clarke Spheroid of 1866.
Range	Distance along the surface of the earth.
Theta P.L.	The angle between the earth-fixed missile velocity and the local vertical. Defined mathematically as
	$\cos^{-1} \left[\frac{\dot{X}\dot{X} + (Y + r_0) \dot{Y} + Z\dot{Z}}{V_g \sqrt{X^2 + (Y + r_0)^2 + Z^2}} \right]$
Cartesian Z	See Cartesian Z above

(U) APPENDIX (Cont.)

X DST Space-fixed velocity components, oriented as the
Y DST Cartesian coordinates, with the effect of the
Z DST initial velocity of the earth taken out.

AT Acceleration along the longitudinal axis of the
 missile (angle of attack always assumed to be zero).

Drag Aerodynamic drag of the missile ($C_d \cdot q \cdot A$).
